DDI-Net 3.0 · QUICK REPORT

Warfarin + Fluconazole

DB00682 · DB00196 · DDI-20261018-092715-BA8302E2 · 18 October 2026, 09:27:15 (UTC, UTC+00:00)

DDI-Net is a research prototype — not a medical device and not clinical decision support. The absence of a documented interaction is not evidence of safety. The BIO-GINE score is a research signal of resemblance to documented pairs, not a probability of clinical harm.

Is there a documented interaction?

Interaction-specific evidence found, clinical outcome unclear

Sources record an interaction (for example a change in concentration) but do not name the clinical consequence.

What could happen?

No specific clinical outcome established from available evidence. This does not mean the combination is safe.

change in exposure | documented, mechanism supported by annotations | severity not established

Higher serum concentration · Warfarin [1]

The source describes a change in how much of a drug is in the body. That, by itself, is not a documented clinical outcome. Severity not established from available evidence.

"The serum concentration of #Drug2 can be increased when it is combined with #Drug1."

DrugBank DDI records via Therapeutics Data Commons · drugbank_type_map/v1:type=73

Why could it happen?

- Fluconazole inhibits CYP2C19, which processes Warfarin (annotations). An exposure change of one of the drugs is documented; that it is this drug follows from the protein roles.
- Fluconazole inhibits CYP2C9, which processes Warfarin (annotations). An exposure change of one of the drugs is documented; that it is this drug follows from the protein roles.
- Fluconazole inhibits CYP3A4, which processes Warfarin (annotations). An exposure change of one of the drugs is documented; that it is this drug follows from the protein roles.

How certain is the information?

Seriousness: Severity not established from available evidence.

[1] DrugBank DDI records via Therapeutics Data Commons · 2026-08-24 · https://tdcommons.ai/multi_pred_tasks/ddi/

- DrugBank (local TDC export): 1 record(s) for the pair. No severity and no stated basis.
- FDA labels unavailable now — not part of this analysis. Drug names are searched, not classes; Adverse Reactions sections are not used.
- Source "FDA labels (openFDA)": unavailable. Its data is not part of this report.
- For 1 of 1 DrugBank records the drug order in the export is not verified, so the report does not say which drug affects which.
- Databases do not record how strongly a drug inhibits or induces a protein, or how much of a drug's handling that protein does.
- The service uses one model checkpoint (seed 0) and provides neither a per-pair confidence interval nor an ensemble estimate. Section 5 gives the quality measured on the held-out test instead — an average over many pairs, not confidence in this pair.

What does BIO-GINE add?

BIO-GINE is a research model that looks for patterns resembling documented interactions. Its score is not a probability of harm or an individual's risk, and it does not affect the status or the outcomes above.

Calibrated score: 0.81 · S2

Important limitation

This platform cannot determine whether a particular combination is safe for an individual. It is a research and educational tool.

The full research report holds every excerpt, the provenance of each statement, the mechanism hypotheses and the model analysis.
