DDI-Net 3.0 · QUICK REPORT

Warfarin + Fluconazole

DB00682 · DB00196 · DDI-20261015-202141-8302A214 · 15 October 2026, 23:21:41 (Europe/Moscow, UTC+03:00)

DDI-Net is a research prototype — not a medical device and not clinical decision support. The absence of a documented interaction is not evidence of safety. The BIO-GINE score is a research signal of resemblance to documented pairs, not a probability of clinical harm.

SYNTHETIC TEST DATA. This report was generated from a test fixture (synthetic:// endpoint). Text marked [synthetic] is not real label text and must not be cited as such.

Is there a documented interaction?

Documented interaction found

Sources name specific consequences or changes in effect for this pair. What they are, and on what basis, is below.

What could happen?

clinical outcome · documented · severity not established

Bleeding [2.1]

The source names this consequence for this pair directly. It gives no frequency and no severity. Severity not established from available evidence.

"Coumarin-type anticoagulants: [synthetic] Prothrombin time may be increased in patients receiving concomitant fluconazole and warfarin in this test fixture, and bleeding events have been reported in association with increases in prothrombin time."

FDA drug label (Structured Product Labeling via openFDA) · PRECAUTIONS, DRUG INTERACTIONS · label_lexicon/v2:term=bleeding

change in effect · documented · severity not established

Change in a blood-clotting measure (prothrombin time / INR) [2.1] [2.2]

The source describes a stronger (or altered) pharmacological effect of one of the drugs. It does not state that a particular harm follows. Severity not established from available evidence.

"Coumarin-type anticoagulants: [synthetic] Prothrombin time may be increased in patients receiving concomitant fluconazole and warfarin in this test fixture, and bleeding events have been reported in association with increases in prothrombin time."

FDA drug label (Structured Product Labeling via openFDA) · PRECAUTIONS, DRUG INTERACTIONS · label_lexicon/v2:term=coagulation_measure · +1

change in exposure · documented, mechanism supported by annotations · severity not established

Higher serum concentration · Warfarin [3]

The source describes a change in how much of a drug is in the body. That, by itself, is not a documented clinical outcome. Severity not established from available evidence.

"The serum concentration of #Drug2 can be increased when it is combined with #Drug1."

DrugBank DDI records via Therapeutics Data Commons · drugbank_type_map/v1:type=73

Why could it happen?

- Fluconazole inhibits CYP2C19, which processes Warfarin (annotations). This drug's exposure change is documented for the pair.
- Fluconazole inhibits CYP2C9, which processes Warfarin (annotations). This drug's exposure change is documented for the pair.
- Fluconazole inhibits CYP3A4, which processes Warfarin (annotations). This drug's exposure change is documented for the pair.

How certain is the information?

Seriousness: Severity not established from available evidence.

[2] FDA drug label (Structured Product Labeling via openFDA) · SPL 00000000-0000-0000-0000-0000000000f1 · 2026-10-15 · https://dailymed.nlm.nih.gov/dailymed/drugInfo.cfm?setid=00000000-0000-0000-0000-0000000000f1

[3] DrugBank DDI records via Therapeutics Data Commons · 2026-08-24 · https://tdcommons.ai/multi_pred_tasks/ddi/

- DrugBank (local TDC export): 1 record(s) for the pair. No severity and no stated basis.
- FDA labels checked. Drug names are searched, not classes; Adverse Reactions sections are not used.
- For 1 of 1 DrugBank records the drug order in the export is not verified, so the report does not say which drug affects which.

- Label excerpts were found by matching drug names: a sentence may concern another formulation, a drug class or a study condition (see the qualifiers in section 3).
- A DrugBank record may itself rest on label text, so labels and DrugBank are not necessarily independent sources.
- Databases do not record how strongly a drug inhibits or induces a protein, or how much of a drug's handling that protein does.

What does BIO-GINE add?

BIO-GINE is a research model that looks for patterns resembling documented interactions. Its score is not a probability of harm or an individual's risk, and it does not affect the status or the outcomes above.

`Calibrated score: 0.81 · S2`

Important limitation

This platform cannot determine whether a particular combination is safe for an individual. It is a research and educational tool.

The full research report holds every excerpt, the provenance of each statement, the mechanism hypotheses and the model analysis.
