DDI-Net 3.0 · QUICK REPORT

Warfarin + Acetylsalicylic acid

DB00682 · DB00945 · DDI-20261015-201753-A10877FD · 15 October 2026, 20:17:53 (UTC, UTC+00:00)

DDI-Net is a research prototype — not a medical device and not clinical decision support. The absence of a documented interaction is not evidence of safety. The BIO-GINE score is a research signal of resemblance to documented pairs, not a probability of clinical harm.

Is there a documented interaction?

Documented interaction found

Sources name specific consequences or changes in effect for this pair. What they are, and on what basis, is below.

What could happen?

change in effect · documented · severity not established

Stronger anticoagulant (blood-thinning) effect [1]

The source describes a stronger (or altered) pharmacological effect of one of the drugs. It does not state that a particular harm follows. Severity not established from available evidence.

“#Drug1 may increase the anticoagulant activities of #Drug2.”

DrugBank DDI records via Therapeutics Data Commons · drugbank_type_map/v1:type=6

Why could it happen?

The available evidence does not establish a mechanism for the documented outcomes. Mechanism hypotheses without a documented outcome are shown in Research mode.

How certain is the information?

Seriousness: Severity not established from available evidence.

[1] DrugBank DDI records via Therapeutics Data Commons · 2026-08-24 · https://tdcommons.ai/multi_pred_tasks/ddi/

- DrugBank (local TDC export): 1 record(s) for the pair. No severity and no stated basis.
- FDA labels unavailable now — not part of this analysis. Drug names are searched, not classes; Adverse Reactions sections are not used.
- Source “FDA labels (openFDA)”: unavailable. Its data is not part of this report.
- For 1 of 1 DrugBank records the drug order in the export is not verified, so the report does not say which drug affects which.
- Databases do not record how strongly a drug inhibits or induces a protein, or how much of a drug's handling that protein does.
- The service uses one model checkpoint (seed 0) and provides neither a per-pair confidence interval nor an ensemble estimate. Section 5 gives the quality measured on the held-out test instead — an average over many pairs, not confidence in this pair.

What does BIO-GINE add?

BIO-GINE is a research model that looks for patterns resembling documented interactions. Its score is not a probability of harm or an individual's risk, and it does not affect the status or the outcomes above.

Calibrated score: 0.76 · S3

Important limitation

This platform cannot determine whether a particular combination is safe for an individual. It is a research and educational tool.

The full research report holds every excerpt, the provenance of each statement, the mechanism hypotheses and the model analysis.
