DDI-Net 3.0 · QUICK REPORT

Warfarin + Fluconazole

DB00682 · DB00196 · DDI-20261016-052235-55786C2D · 16 October 2026, 05:22:35 (UTC, UTC+00:00)

DDI-Net is a research prototype — not a medical device and not clinical decision support. The absence of a documented interaction is not evidence of safety. The BIO-GINE score is a research signal of resemblance to documented pairs, not a probability of clinical harm.

Is there a documented interaction?

Documented interaction found

Sources name specific consequences or changes in effect for this pair. What they are, and on what basis, is below.

What could happen?

clinical outcome · documented · severity not established

Bleeding [2]

The reference set names this consequence for this pair. It gives no frequency; the severity grades the compendia give are not reproduced here. Severity not established from available evidence. The compendia behind CRESCENDDI grade severity, but their grades are not reproduced here.

"CRESCENDDI lists "Haemorrhage" (MedDRA 10055798) as an adverse event of the interaction between fluconazole and warfarin, mapped from the Micromedex interaction description."

CRESCENDDI reference set (Kontsioti et al., Sci Data 2022) · meddra_effect_map/v1:meddra=10055798

change in exposure · documented, mechanism supported by annotations · severity not established

Higher serum concentration · Warfarin [1]

The source describes a change in how much of a drug is in the body. That, by itself, is not a documented clinical outcome. Severity not established from available evidence.

"The serum concentration of #Drug2 can be increased when it is combined with #Drug1."

DrugBank DDI records via Therapeutics Data Commons · drugbank_type_map/v1:type=73

Why could it happen?

- Fluconazole inhibits CYP2C19, which processes Warfarin (annotations). This drug's exposure change is documented for the pair.
- Fluconazole inhibits CYP2C9, which processes Warfarin (annotations). This drug's exposure change is documented for the pair.
- Fluconazole inhibits CYP3A4, which processes Warfarin (annotations). This drug's exposure change is documented for the pair.

How certain is the information?

Seriousness: Severity not established from available evidence.

[1] DrugBank DDI records via Therapeutics Data Commons · 2026-08-24 · https://tdcommons.ai/multi_pred_tasks/ddi/

[2] CRESCENDDI reference set (Kontsioti et al., Sci Data 2022) · 2026-10-16 · https://github.com/elpidakon/CRESCENDDI

- DrugBank (local TDC export): 1 record(s) for the pair. No severity and no stated basis.
- CRESCENDDI reference set (BNF, Micromedex, ANSM; 2018–2019): 1 pair–event record(s). It covers only pairs common to all three compendia.
- FDA labels unavailable now — not part of this analysis. Drug names are searched, not classes; Adverse Reactions sections are not used.
- Source "FDA labels (openFDA)": unavailable. Its data is not part of this report.
- For 1 of 1 DrugBank records the drug order in the export is not verified, so the report does not say which drug affects which.
- Databases do not record how strongly a drug inhibits or induces a protein, or how much of a drug's handling that protein does.
- The service uses one model checkpoint (seed 0) and provides neither a per-pair confidence interval nor an ensemble estimate. Section 5 gives the quality measured on the held-out test instead — an average over many pairs, not confidence in this pair.

What does BIO-GINE add?

BIO-GINE is a research model that looks for patterns resembling documented interactions. Its score is not a probability of harm or an individual's risk, and it does not affect the status or the outcomes above.

Calibrated score: 0.81 · S2

Important limitation

This platform cannot determine whether a particular combination is safe for an individual. It is a research and educational tool.

The full research report holds every excerpt, the provenance of each statement, the mechanism hypotheses and the model analysis.
