A Machine-readable summary (JSON)

RESEARCH USE ONLY

DDI-Net is a research prototype — not a medical device and not clinical decision support. The absence of a documented interaction is not evidence of safety. The BIO-GINE score is a research signal of resemblance to documented pairs, not a probability of clinical harm.

1 Executive summary

- Drugs analysed: 6; unique pairs: 15. Each pair was examined on its own.

Pairs by kind of documentation found:

CI	Contraindication in a label	0
L	Named in a label	0
≠	Sources conflict	0
DB	Documented in a database	13
M	Model signal only	1
–	No documentation found — does not mean “safe”	1

- Pairs flagged by the service for a closer look: 14.
- Pairs whose own record the model was trained on (score not counted): 5.

> There is no overall score for the set, and none is computed: pairwise findings cannot be added up into a conclusion about several medicines together.

> Each pair is examined on its own. Pairwise findings say nothing about how three or more drugs behave together: no such model has been built or validated.

Uncertainty and evidence gaps

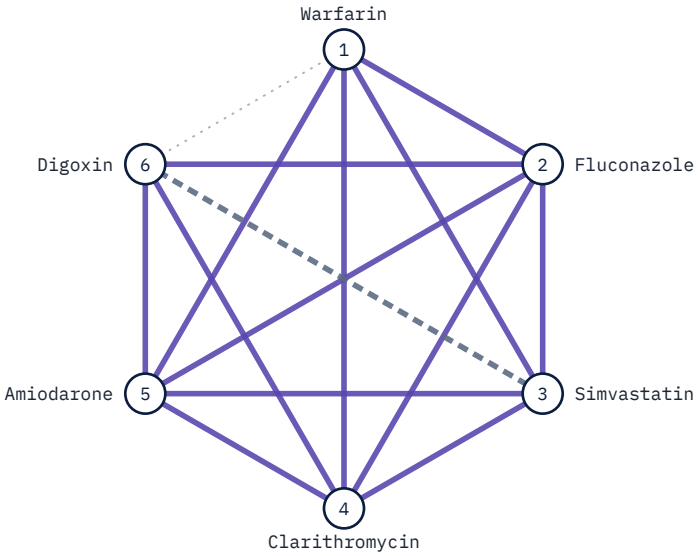

- Source “FDA labels (openFDA)”: unavailable. Its data is not part of this report.
- The service uses one model checkpoint (seed 0) and provides neither a per-pair confidence interval nor an ensemble estimate. Section 5 gives the quality measured on the held-out test instead — an average over many pairs, not confidence in this pair.
- No source gives a severity, and none is assigned here.
- Doses, duration, age, kidney and liver function, other medicines and individual factors are not taken into account.

2 Overview of the drugs

#	INTERNATIONAL NAME (INN)	RUSSIAN NAME	DRUGBANK ID	DRUGBANK GROUPS	TYPE
1	warfarin	варфарин (transliteration)	DB00682	approved	small molecule
2	fluconazole	флуконазол (transliteration)	DB00196	approved, investigational	small molecule
3	simvastatin	симвастатин (transliteration)	DB00641	approved	small molecule
4	clarithromycin	кларитромицин (-transliteration)	DB01211	approved	small molecule
5	amiodarone	амиодарон (transliteration)	DB01118	approved, investigational	small molecule
6	digoxin	дигоксин (transliteration)	DB00390	approved	small molecule

Identifiers: DrugBank. INN: DrugCentral, joined on InChIKey (no value means no match). Russian names: rule-based transliteration — an interface label, not sourced data.

3 Pairwise map

Lines: solid — database or label record; dashed — model signal only; dotted — no documentation found. A thick line marks a pair flagged for a closer look.

Pair matrix

Each cell is the kind of documentation found for the pair (row × column); the number is the calibrated model score. Colour encodes the kind of source, not danger. “n/c” — not counted: the model was trained on this pair's record.

	1	2	3	4	5	6
1 Warfarin		DB 0.81	DB 0.48	DB 0.49	DB 0.83	– 0.45
2 Fluconazole			DB n/c	DB 0.91	DB n/c	DB n/c
3 Simvastatin				DB 0.84	DB n/c	M 0.58
4 Clarithromycin					DB 0.98	DB 0.53
5 Amiodarone						DB n/c
6 Digoxin						

CI Contraindication in a label **L** Named in a label **≠** Sources conflict **DB** Documented in a database **M** Model signal only
– No documentation found

4 All pairs: evidence and model

For each pair the service reports the number of mechanism hypotheses; the hypotheses, proteins and pathways themselves are in the per-pair report (Analyzer). “Labels (excerpts)”: the number of FDA labels naming the other drug of the pair, and in brackets the distinct excerpts from them; several excerpts of one label are one source.

PAIR	WHAT WAS FOUND	DRUGBANK	LABELS (EXCERPTS)	HYP.	MODEL	WHY LOOK CLOSER
Warfarin + Fluconazole 1–2 · DB00682 · DB00196	Documented in a database	1	0 (0)	3	0.81 S2	database record; pharmacokinetic mechanism hypothesis
Warfarin + Simvastatin 1–3 · DB00682 · DB00641	Documented in a database	1	0 (0)	4	0.48 S2	database record; pharmacokinetic mechanism hypothesis
Warfarin + Clarithromycin 1–4 · DB00682 · DB01211	Documented in a database	1	0 (0)	2	0.49 S3	database record; pharmacokinetic mechanism hypothesis
Warfarin + Amiodarone 1–5 · DB00682 · DB01118	Documented in a database	1	0 (0)	7	0.83 S2	database record; pharmacokinetic mechanism hypothesis
Fluconazole + Simvastatin 2–3 · DB00196 · DB00641	Documented in a database	1	0 (0)	3	not counted S1	database record; pharmacokinetic mechanism hypothesis
Fluconazole + Clarithromycin 2–4 · DB00196 · DB01211	Documented in a database	1	0 (0)	3	0.91 S2	database record; pharmacokinetic mechanism hypothesis
Fluconazole + Amiodarone 2–5 · DB00196 · DB01118	Documented in a database	1	0 (0)	2	not counted S1	database record; pharmacokinetic mechanism hypothesis
Fluconazole + Digoxin 2–6 · DB00196 · DB00390	Documented in a database	1	0 (0)	1	not counted S1	database record; pharmacokinetic mechanism hypothesis
Simvastatin + Clarithromycin 3–4 · DB00641 · DB01211	Documented in a database	1	0 (0)	5	0.84 S2	database record; pharmacokinetic mechanism hypothesis
Simvastatin + Amiodarone 3–5 · DB00641 · DB01118	Documented in a database	1	0 (0)	5	not counted S1	database record; pharmacokinetic mechanism hypothesis
Clarithromycin + Amiodarone 4–5 · DB01211 · DB01118	Documented in a database	1	0 (0)	5	0.98 S2	database record; pharmacokinetic mechanism hypothesis
Clarithromycin + Digoxin 4–6 · DB01211 · DB00390	Documented in a database	1	0 (0)	5	0.53 S2	database record; pharmacokinetic mechanism hypothesis
Amiodarone + Digoxin 5–6 · DB01118 · DB00390	Documented in a database	1	0 (0)	3	not counted S1	database record; pharmacokinetic mechanism hypothesis
Simvastatin + Digoxin 3–6 · DB00641 · DB00390	Model signal only	0	0 (0)	5	0.58 S1	model signal without documentation; pharmacokinetic mechanism hypothesis
Warfarin + Digoxin 1–6 · DB00682 · DB00390	No documentation found does not mean “safe”	0	0 (0)	0	0.45 S2	—

5 Coverage and uncertainty

- The regime says whether the pair's drugs were in the model's training set: S1 — both (not evaluated), S2 — one, S3 — neither.
- For each pair the service reports the number of mechanism hypotheses; the hypotheses, proteins and pathways themselves are in the per-pair report (Analyzer).
- The service uses one model checkpoint (seed 0) and provides neither a per-pair confidence interval nor an ensemble estimate. Section 5 gives the quality measured on the held-out test instead — an average over many pairs, not confidence in this pair.

Pairs whose score is not counted

- Fluconazole + Simvastatin (S1)
- Fluconazole + Amiodarone (S1)
- Fluconazole + Digoxin (S1)
- Simvastatin + Amiodarone (S1)
- Amiodarone + Digoxin (S1)

SHA-256 of the response data	`49f902e1ac42fe62a771ab945be490c362aed34dd1f004868eb3483096f5d46a` Hash of the service response(s) as canonical JSON (keys sorted, serialised with JSON.stringify). The same hash is in the companion JSON file, available from the “JSON” button next to “Export PDF”.

7 Limitations

Core limitations

- DDI-Net is a research tool, not clinical decision support and not a medical device. Decisions about medicines belong to a doctor or pharmacist.
- Unlabelled pairs are not confirmed safe. A missing record means only that the sources checked do not contain one.
- BIO-GINE scores are not calibrated probabilities of clinical harm: temperature scaling was fitted on validation pairs at 50% prevalence against randomly drawn unlabelled pairs.
- The drug order in the DrugBank (TDC) export was verified by measurement for only two interaction types; for the others it is either meaningless (symmetric types) or unverified, so directional claims (“A raises the level of B”) are not made.

- External medical evidence (FDA labels, RxNorm) may be incomplete or unavailable at query time; its status is listed under “Sources checked”.
- Pairwise results say nothing about three or more drugs taken together; no such model exists here, and no overall score is computed.

> RESEARCH USE ONLY
> This is a research prototype, not a medical device. It does not replace a doctor or pharmacist and cannot say whether a combination is safe for a particular person.

8 Glossary

Plain explanations of the terms used in this report.

Source evidence vs model prediction	Source evidence is text that an official label or a database actually contains about these two drugs. A model prediction is a number BIO-GINE computes from patterns in the data it was trained on. The first records what is known; the second is a research guess.
FDA label (SPL)	A medicine's official prescribing information in the United States, published by the FDA as Structured Product Labeling. One label is one document with its own set ID, divided into sections such as Warnings or Drug Interactions.
Document and excerpt	An excerpt is one sentence quoted from a document. Several excerpts of one label are still one source and do not confirm each other. When a label repeats a sentence in two sections, it is shown once.
DrugBank (TDC export)	A large database of drugs and known interactions; DDI-Net uses the public copy distributed by Therapeutics Data Commons. A record states only an interaction type, in a standard sentence, with no severity and no note of what it is based on.
Direction	Which drug affects which. For most interaction types the drug order in the DrugBank export is unreliable, so the report names no direction from DrugBank. Label sentences are quoted as written; no direction is inferred from the mere fact that one drug's label names the other.
Cytochrome P450 (CYP450)	A family of enzymes, mostly in the liver (for example CYP2C9, CYP3A4), that break down many medicines. If one drug slows an enzyme that breaks down another, the second may stay in the body longer.
Substrate, inhibitor, inducer	A substrate is a drug a protein processes. An inhibitor slows the protein down. An inducer makes the body produce more of it.
Mechanism hypothesis	A possible biological explanation assembled from what databases record about each drug separately (for example: drug X inhibits an enzyme that processes drug Y). It was not tested for this pair and says nothing about the size of any effect.
Reactome pathway	A curated chain of reactions in the cell. Two drugs sharing a pathway is background information, not a cause of interaction.
Raw and calibrated score	The raw score is the model's direct output between 0 and 1; the calibrated score is the same output rescaled on balanced validation pairs. Both put pairs in the same order. Neither is a probability of harm.
Regimes S1, S2, S3	Whether the model saw the drugs during training. S1: both drugs were in training (quality not measured). S2: one drug was not in training. S3: neither was — the hardest test.
Held-out test; “pooled”	Pairs set aside in advance and never used for training; quality is measured on them. “Pooled” means S2 and S3 test pairs measured together (84,690 pairs, 7,758 of them S3).
AUROC	The chance that the model ranks a randomly chosen documented pair above a randomly chosen pair from the comparison set (random pairs without a record). 0.5 is guessing; 1 is a perfect ranking.
AUPRC	Area under the precision–recall curve: how well the model finds documented pairs without raising many false alarms, over all thresholds at once. Half of the test pairs are documented, so guessing gives about 0.5; 1 is perfect.

± (spread between runs)	The model was trained 5 times, each from a different random starting point (seed). “±” is the standard deviation of the result between those runs. It is not an error bar for a single pair.

A Appendix A. Machine-readable summary (JSON)

Key fields as JSON for automated checking. The full service responses are in the companion JSON file (same SHA-256).
